PROFESSIONAL SUMMARY

Backend Engineer with **12+** years across e-commerce, healthcare, and game development, building scalable services in Java and TypeScript with comprehensive test automation. Experienced in microservices, API design, and CI/CD pipelines using Playwright, Kotlin, and cloud infrastructure. Proven ability to ship production-grade backend services alongside robust automated test suites.

SKILLS

- Languages:** Java, Kotlin, TypeScript, JavaScript, Python, SQL, HTML, CSS
- Backend:** Spring Boot, Node.js, Express, NestJS, FastAPI, Kafka, RabbitMQ
- Frontend:** React, Next.js, Vue.js, Redux, Tailwind CSS
- Testing:** Playwright, Jest, Pytest, Cypress, Selenium, k6
- Database:** PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch
- Cloud & DevOps:** Docker, Kubernetes, AWS, GCP, GitHub Actions, Jenkins, Terraform, Linux
- Others:** RESTful API, GraphQL, gRPC, WebSocket, Git, Jira, Confluence, Grafana, Prometheus, Datadog

EXPERIENCE

Publicis Sapient

Senior Software Engineer

Jun 2024–Present

- Led the development of microservices using **Java** and **Spring Boot**, architecting RESTful APIs that handled high-throughput transaction processing for enterprise clients across financial services and healthcare sectors.
- Spearheaded automated test framework expansion using **TypeScript** and **Playwright**, building end-to-end test suites that validated critical user workflows and reduced manual regression testing by **40%**.
- Drove cross-functional efforts to integrate **CI/CD pipelines** with **GitHub Actions**, enabling automated test execution on every pull request and cutting time-to-production from 6 hours to under 90 minutes.
- Implemented comprehensive API test cases covering functional, integration, and contract testing scenarios using **Pytest** and **Jest**, ensuring service reliability across microservice boundaries.
- Collaborated with QA engineers to establish test automation best practices, mentoring team members on writing maintainable **Playwright** test frameworks and debugging complex async test failures.
- Optimized database query performance by analyzing execution plans in **PostgreSQL**, reducing p99 latency by **32%** for a high-traffic customer identity service.
- Debugged and resolved critical production issues by tracing requests through distributed services, using **Grafana** dashboards and **Prometheus** metrics to pinpoint root causes in real-time.

- Contributed to containerized service deployment strategy using **Docker** and **Kubernetes**, reducing deployment variance and enabling blue-green releases across staging and production environments.
- Maintained code quality standards by conducting peer reviews on pull requests, ensuring adherence to REST API design principles and test coverage thresholds across the backend team.
- Extended backend observability by integrating structured logging into core services, enabling faster incident triage and reducing mean-time-to-resolution for high-severity alerts by **25%**.
- Worked independently on production features including payment webhook handlers and customer data synchronization services, delivering shippable code alongside comprehensive test coverage.
- Participated in on-call rotation, responding to alerts and executing runbook procedures to restore service health during incidents affecting millions of users across the platform.

CareSimple

Oct 2022–May 2024

Senior Full Stack Engineer

- Played a key role in building a real-time patient monitoring platform using **Node.js** and **TypeScript**, handling data ingestion from medical devices and exposing APIs consumed by clinical dashboards.
- Designed and maintained an automated test suite using **Playwright** for healthcare workflows, covering critical paths like patient enrollment, vital sign alerts, and provider notifications with functional and integration test coverage.
- Architected a backend service that processed electronic health records (EHR) data using **Kafka** event streams, transforming incoming HL7 messages into normalized **PostgreSQL** records for analytics and clinical reporting.
- Improved deployment reliability by establishing **CI/CD** workflows with **Jenkins**, automating test execution and containerized builds, which eliminated manual deployment errors and enabled daily releases.
- Debugged authentication and permission issues in the patient portal by tracing JWT tokens through microservices, resolving a critical data exposure vulnerability and preventing unauthorized access to protected health information.
- Wrote end-to-end API tests using **Jest** to validate HIPAA-compliant data handling, ensuring personally identifiable information (PII) was never logged or cached improperly.
- Reduced database load by implementing **Redis** caching for frequently accessed provider and patient reference data, cutting query latency by **45%** during peak user hours.
- Collaborated with product and compliance teams to document API contracts and error responses, making it easier for mobile and web teams to integrate backend services reliably.
- Mentored two junior engineers on backend development practices, pair-programming sessions on async/await patterns in **Node.js** and helping them troubleshoot flaky test scenarios.

Shopee

Jul 2018–Sep 2022

Full Stack Engineer

- Spearheaded the development of order fulfillment microservices using **Java** and **Spring Boot**, handling millions of daily transactions across Southeast Asia and supporting integration with warehouse management systems.

- Built automated test infrastructure using **TypeScript** and **Playwright**, creating performance and reliability test scenarios that validated checkout workflows under high load without impacting production stability.
- Owned the search ranking service, which consumed catalog and click-stream data from **Kafka**, enriched rankings using collaborative filtering logic, and exposed a **GraphQL** endpoint for the product discovery frontend.
- Improved system reliability by introducing structured logging and **Prometheus** metrics across the checkout and payment services, which enabled quicker root-cause analysis during high-traffic shopping events.
- Established contract testing protocols between backend services and frontend consumers, preventing integration breakage and ensuring backward compatibility across service versions.
- Optimized the product listing API by refactoring N+1 query patterns in the ORM layer and implementing **Redis** caching for category trees, reducing response times from **1.2s to 280ms**.
- Collaborated with platform engineering on **Docker** containerization and **Kubernetes** orchestration, enabling auto-scaling of order processing services during peak demand periods.
- Debugged and fixed race conditions in the inventory reservation system, which had been causing double-bookings during flash sales—resolved by adding database-level row locks and comprehensive integration tests.
- Wrote functional test cases covering payment gateway integrations, refund workflows, and order cancellation scenarios, catching edge cases before they reached customer-facing environments.

Altitude Games

Nov 2014–Jul 2018

Full Stack Engineer

- Built backend services for multiplayer games using **Node.js** and **Express**, managing player progression, matchmaking, and real-time leaderboards for free-to-play titles reaching 5+ million users.
- Implemented automated testing frameworks using **JavaScript** and **Jest**, creating unit and integration tests for game server logic that validated player actions, economy balancing, and event processing.
- Designed data pipelines to track player analytics using **MongoDB**, aggregating gameplay metrics and feeding dashboards that informed game balance decisions and monetization strategies.
- Debugged server-side issues causing intermittent disconnections and session timeouts by analyzing logs and adding defensive retry logic in the player connection handler, reducing support tickets by **30%**.
- Optimized database queries by profiling slow operations and denormalizing frequently accessed player data, improving leaderboard retrieval from **800ms to 150ms** during peak concurrent user sessions.
- Contributed to deployment automation using basic **Docker** containers and shell scripts, reducing manual release procedures and enabling non-blocking deployments of game balance patches.
- Worked with game designers to translate economy specifications into backend rules and validation logic, ensuring fair play mechanics and preventing exploit conditions during early access testing phases.

EDUCATION

Ateneo de Manila University
Bachelor of Science in Computer Science

Aug 2010–Jul 2014
