PROFESSIONAL SUMMARY

Senior Fullstack Developer with **12+** years across healthcare, e-commerce, and gaming, building scalable distributed systems in Node.js and React with TypeScript. Proven expertise in microservices architecture, event-driven pipelines, and cloud infrastructure on AWS. Adept at cross-functional collaboration, implementing CI/CD practices, and delivering enterprise-grade applications that balance performance with maintainability.

SKILLS

- Languages:** TypeScript, JavaScript, Python, SQL, HTML, CSS
- Backend:** Node.js, Express, NestJS, FastAPI, gRPC, Kafka, RabbitMQ
- Frontend:** React, Next.js, Redux, React Query, Tailwind CSS, Material-UI, Webpack, Vite
- Database:** PostgreSQL, MongoDB, Redis, Elasticsearch, DynamoDB
- Testing:** Jest, Pytest, Cypress, Playwright, React Testing Library, Vitest
- Cloud & DevOps:** AWS, Azure, Docker, Kubernetes, Terraform, GitHub Actions, Azure DevOps, GitLab CI, EC2, S3, RDS, Lambda, CloudWatch, Jenkins
- Others:** RESTful API, GraphQL, WebSocket, Microservices, Event-driven Architecture, Git, GitHub, Agile, Scrum, Datadog, Prometheus, Grafana, Jira, Confluence

EXPERIENCE

Publicis Sapient Jun 2024–Present
Senior Software Engineer

- Led the architecture and development of a multi-tenant digital platform using **Node.js** and **React**, integrating with agentic AI systems to deliver intelligent automation capabilities across Financial Services and Healthcare verticals.
- Spearheaded the migration of legacy monolithic services to a **microservices** architecture, decomposing business logic into domain-driven services that communicate via **Kafka** event streams and **RESTful API** contracts, reducing deployment coupling by 60%.
- Drove cross-functional initiatives with product, design, and data teams to define scalable **TypeScript** development standards and CI/CD best practices using **GitHub Actions**, enabling 15 engineers to ship features with confidence on a bi-weekly cadence.
- Architected and implemented a sophisticated error tracking and observability stack using **Datadog** and **Prometheus**, correlating frontend errors with backend logs across containerized services, which reduced mean-time-to-resolution from 4 hours to under 45 minutes.

- Collaborated with infrastructure engineers to design and provision cloud infrastructure on **AWS**, leveraging **Terraform** to manage **EC2**, **RDS**, and **Lambda** deployments across staging and production environments, eliminating manual provisioning and reducing infrastructure drift.
- Built and maintained a shared **React** component library with TypeScript strict mode enabled, documenting patterns for form handling, data fetching with **React Query**, and state management with **Redux**, accelerating feature delivery across three product teams.
- Mentored three mid-level engineers on distributed system design, emphasizing trade-offs between consistency, availability, and partition tolerance, resulting in improved incident response and technical decision-making across the platform.
- Owned the redesign of the authentication and authorization layer using OAuth2 and JWT tokens, integrating with enterprise identity providers and implementing role-based access control that supported compliance requirements across regulated industries.
- Implemented comprehensive end-to-end testing using **Playwright** to cover critical user journeys across checkout, payment, and account management flows, reducing production bugs by **32%** and enabling faster release cycles.
- Optimized React component rendering and reduced bundle size from 580KB to 240KB by eliminating unused dependencies, code-splitting route-based modules, and lazy-loading images, cutting initial page load time by **58%** on 4G networks.
- Established automated performance monitoring using **New Relic**, tracking Core Web Vitals and database query performance in production, which surfaced a memory leak in the session store that had been causing intermittent 503 errors.

CareSimple

Oct 2022–May 2024

Senior Full Stack Engineer

- Spearheaded the development of a patient-facing telehealth dashboard using **React** and **TypeScript**, integrating real-time health metrics from IoT devices via **WebSocket** connections, enabling clinicians to monitor 2,000+ high-risk patients simultaneously.
- Drove the design and implementation of the Remote Patient Monitoring (RPM) data ingestion pipeline using **Node.js**, **Kafka**, and **PostgreSQL**, processing 50,000+ daily events from wearables and medical devices with at-most-once delivery guarantees and automatic dead-letter queuing.
- Owned the modernization of the internal admin portal from a legacy jQuery application to a **Next.js** and **React Query** frontend with a **NestJS** backend, reducing query waterfalls and cutting page load time from 3.2 seconds to **620ms**, improving daily active admin usage by 40%.
- Collaborated with the data team to design a normalized **PostgreSQL** schema for clinical events, implementing efficient queries and materialized views that enabled real-time dashboards showing patient cohorts and outcome trends without hitting rate limits.
- Built a robust API gateway and service discovery pattern using **Express** middleware and **Redis** caching, routing requests across nine internal microservices while maintaining backward compatibility and reducing response latency by **45%**.

- Implemented end-to-end security controls including encrypted payload transmission, field-level data masking for PII, and role-based API access using **TypeScript** decorators, passing HIPAA compliance audits without rework.
- Led on-call rotations and incident response, investigating production issues across the full stack — resolving database connection pool exhaustion, debugging race conditions in state reconciliation, and coordinating 23-person war rooms for critical system outages.
- Championed the adoption of **Jest** and **React Testing Library** for unit and component testing, establishing test coverage thresholds and code review practices that eliminated recurrent regressions in the patient-facing UI.

Shopee

Jul 2018–Sep 2022

Full Stack Engineer

- Built core e-commerce features for a marketplace serving 100+ million users across Southeast Asia, developing the product listing service in **Node.js** with **Express**, handling search queries, filtering, and sorting for 40,000+ requests per second using **Redis** and **Elasticsearch**.
- Implemented the checkout and order management system using **React** for the frontend and **TypeScript** with **NestJS** for backend services, integrating payment processing, inventory synchronization, and order tracking across seller and buyer platforms.
- Designed and deployed event-driven order processing using **Kafka** topics, decoupling payment processing, shipment notifications, and seller fulfillment workflows, which reduced order completion time from 8 seconds to **2.1 seconds** and improved seller response latency.
- Optimized the product search infrastructure by migrating aggregations from **PostgreSQL** to **Elasticsearch**, implementing faceted search and real-time inventory updates that reduced query latency from 800ms to **120ms**, directly supporting conversion rate improvements of **18%**.
- Owned the shipping integration layer that connected 15+ regional logistics providers using standardized **RESTful API** contracts, implementing retry logic, timeout handling, and fallback providers to ensure 99.7% uptime during peak sale periods.
- Built admin dashboards and monitoring tools using **React** and **Grafana**, visualizing real-time metrics for order flow, payment disputes, and seller performance, enabling faster decision-making and reducing fraud investigation time by **35%**.
- Contributed to the transition from monolithic PHP to microservices architecture, helping migrate product and category services to **Node.js** and establishing **Docker** containerization standards that enabled independent scaling and deployment across 40+ engineers.
- Implemented comprehensive logging and error tracking using **ELK Stack** (Elasticsearch, Logstash, Kibana) and centralized alerts in **Datadog**, reducing mean-time-to-detection for critical issues by **50%** and improving observability across distributed services.

Altitude Games

Nov 2014–Jul 2018

Full Stack Engineer

- Contributed to the full-stack development of free-to-play mobile games, building the backend game server in **Node.js** and **Express** that handled 500K+ daily active users, managing player progression, in-app purchases, and real-time multiplayer state synchronization.
- Implemented player analytics and telemetry pipelines using **Python** and **PostgreSQL**, aggregating gameplay events and monetization data to inform game balance decisions, feature prioritization, and cohort retention analysis for studio leadership.
- Owned the in-game shop and currency system, developing a **React**-based admin interface for managing pricing, seasonal promotions, and inventory across multiple regional storefronts, reducing shop update time from 2 hours to **15 minutes** through automated deployment.
- Built cross-platform leaderboard and matchmaking services using **Node.js**, **Redis** sorted sets, and **WebSocket**, matching thousands of concurrent players with latency under 500ms and reducing queue wait times by **40%** during peak gaming hours.
- Designed and deployed game servers on **AWS** using **Docker** containers and **Kubernetes** for horizontal scaling, implementing auto-scaling policies and graceful shutdown to handle traffic spikes during new content releases without service interruption.
- Collaborated with game designers on economy modeling and progression systems, implementing **TypeScript** validation schemas and database migrations to test balance changes safely before live deployment, reducing economy resets and player dissatisfaction incidents.

EDUCATION

Ateneo de Manila University

Aug 2010–Jul 2014

Bachelor of Science in Computer Science
