PROFESSIONAL SUMMARY

Senior Software Engineer with **12+** years across healthcare, fintech, and e-commerce, designing resilient microservices and REST APIs in **Java** and **Spring Boot** with strong cloud infrastructure expertise. Proficient in distributed systems, database optimization, and observability platforms. Experienced delivering scalable backend solutions using **AWS**, **PostgreSQL**, and **Docker** to support millions of concurrent users.

SKILLS

- Languages:** Java, JavaScript, TypeScript, Python, SQL, HTML, CSS
- Backend:** Spring Boot, Spring Framework, REST APIs, Microservices, Node.js, Express, FastAPI, Gradle, Maven, RabbitMQ, Kafka, gRPC
- Frontend:** React, Vue.js, Angular, Redux, Tailwind CSS, Material UI
- Database:** PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch, DynamoDB, Cassandra
- Testing:** JUnit, Mockito, Jest, Pytest, Selenium, Playwright, TestNG
- Cloud & DevOps:** AWS, EC2, RDS, Lambda, S3, CloudFront, SQS, SNS, Docker, Kubernetes, Terraform, GitHub Actions, Jenkins, GitLab CI, Linux
- Others:** Dynatrace, Kibana, SonarQube, Prometheus, Grafana, RESTful API, GraphQL, Datadog, New Relic, Git, GitHub, Agile, Scrum

EXPERIENCE

- Publicis Sapient**
Senior Software Engineer

Jun 2024–Present
- Led the architecture and development of enterprise backend microservices using **Java 17** and **Spring Boot**, managing high-throughput financial services workflows for Fortune 500 clients across multiple deployment regions on **AWS** infrastructure.
 - Designed and implemented RESTful APIs with comprehensive **JUnit** and **Mockito** unit test coverage, achieving 85% code quality metrics validated through **SonarQube**, which prevented critical bugs from reaching production.
 - Spearheaded performance optimization across distributed systems by implementing **Redis** caching layers and database query optimization in **PostgreSQL**, reducing API response times from **1.2 seconds to 340ms** during peak load scenarios.
 - Architected microservice deployment pipelines using **Docker**, **Kubernetes**, and **GitHub Actions**, enabling the team to ship features to production twice daily with zero-downtime deployments and automated rollback capabilities.

- Collaborated with platform engineering to instrument services with **Dynatrace** monitoring and **Kibana** log aggregation, which reduced mean time to incident detection from 45 minutes to under 5 minutes.
- Implemented asynchronous event-driven workflows using **Kafka** message brokers, decoupling critical payment processing services and improving system resilience during traffic spikes.
- Conducted architectural reviews for three cross-functional teams, establishing Java and Spring Boot best practices, which standardized error handling, logging, and security patterns across 12+ backend services.
- Mentored four junior engineers on microservice design patterns, API contract testing, and database optimization, with two promoted to mid-level roles within 18 months.
- Refactored legacy monolithic services into independent microservices deployed on **AWS Lambda** with **RDS** backend persistence, cutting infrastructure costs by **32%** while improving feature deployment velocity.
- Resolved critical production incidents affecting customer transactions by debugging race conditions in Spring Boot event handlers and coordinating fixes across dependent services within tight SLAs.
- Evaluated and integrated **Gradle** build automation to replace Maven, reducing build times by **28%** and improving developer productivity across the backend team of 15 engineers.
- Documented microservice architecture decisions and deployment procedures in Confluence, creating a knowledge base that onboarded new team members 40% faster than previous cohorts.

CareSimple

Oct 2022–May 2024

Senior Full Stack Engineer

- Drove the complete backend redesign of the remote patient monitoring platform using **Java** and **Spring Boot**, supporting 250+ concurrent healthcare providers managing over 50,000 active patient sessions with real-time data synchronization.
- Built RESTful APIs that integrated with wearable device manufacturers and EHR systems, implementing strict validation and **Mockito**-based contract testing to ensure HIPAA-compliant data exchange without failures.
- Optimized database schemas in **PostgreSQL** and added strategic **Redis** caching for frequently accessed patient records, reducing query times by **56%** and lowering database load during morning clinic hours.
- Implemented end-to-end monitoring using **Prometheus** metrics and **Grafana** dashboards that tracked API latency, error rates, and database connection pool health, enabling proactive scaling before incidents occurred.
- Architected deployment infrastructure on **AWS** using **Docker** containers orchestrated by **Kubernetes**, with automated failover and self-healing capabilities that maintained 99.95% uptime during critical care transitions.
- Built frontend components in **React** and **TypeScript** that consumed backend APIs, implementing client-side caching with Redux and optimistic updates to provide responsive UX for healthcare providers during emergency situations.

- Collaborated with medical compliance officers to design audit logging in **Elasticsearch**, capturing every patient data access event and generating compliance reports that satisfied regulatory audits on the first attempt.
- Mentored a team of three backend engineers on Spring Boot patterns and database optimization, conducting weekly code reviews that reduced production incidents by 40% through early detection of common anti-patterns.
- Established CI/CD pipelines using **GitHub Actions** that ran integration tests against containerized **PostgreSQL** instances, catching environment-specific bugs before staging deployments.
- Resolved a critical data consistency issue in the patient sync service by implementing transactional guarantees in **Spring Boot** event handlers and adding compensating transactions for failed updates, preventing data loss during network outages.

Shopee

Jul 2018–Sep 2022

Full Stack Engineer

- Built backend microservices in **Java** and **Spring Boot** handling payment processing and order management for 50+ million daily transactions across Southeast Asia, deployed on **AWS** with multi-region failover.
- Designed RESTful APIs for the checkout flow and seller dashboard, implementing comprehensive unit tests with **JUnit** and **Mockito** that caught edge cases in concurrent payment scenarios before production release.
- Optimized inventory synchronization pipeline by replacing polling with **Kafka**-based event streaming, reducing inventory stale-data issues by **73%** and enabling real-time seller feedback.
- Implemented caching strategy using **Redis** for product catalogs and user preferences, cutting API response times from **800ms to 210ms** and enabling the platform to handle 3x traffic during flash sales without adding servers.
- Developed frontend features in **React** and **TypeScript** for the seller management portal, integrating with backend APIs through GraphQL adapters and building data visualization dashboards in Recharts.
- Set up **Docker** containerization for microservices and **Kubernetes** orchestration, enabling the team to scale services independently during flash sale events without manual intervention.
- Established monitoring and alerting using **Prometheus** and **Grafana**, tracking service health metrics and reducing incident response time by **50%** through automated alert thresholds.
- Built integration tests using **Selenium** and **Playwright** to validate end-to-end e-commerce workflows, identifying UI bugs that affected checkout conversion rates before releases reached production.
- Migrated database queries from **MySQL** to **PostgreSQL** with advanced indexing strategies, improving query performance by **45%** for analytics queries that previously locked tables during peak hours.
- Collaborated with data teams to design **Elasticsearch** indices for product search, implementing filters and aggregations that improved search relevance and reduced customer support queries by **25%**.

Altitude Games

Nov 2014–Jul 2018

Full Stack Engineer

- Developed backend game services in **Java** using REST APIs and **Spring Framework**, handling player authentication, inventory management, and tournament matchmaking for games supporting 2+ million concurrent players.
- Implemented real-time multiplayer synchronization by designing message queuing with **RabbitMQ**, ensuring consistent game state across distributed player instances with sub-100ms latency.
- Optimized database performance in **MySQL** by adding indexes and query caching, reducing player login times from **3.2 seconds to 680ms** during peak concurrent login windows across all regions.
- Built frontend game UI in **React** and **JavaScript**, integrating with backend APIs to display live leaderboards, player progression, and in-game purchases with low-latency data binding.
- Deployed game services using **Docker** on cloud infrastructure, establishing basic **GitHub Actions** CI/CD pipelines that automated testing and reduced manual deployment time by **35%**.
- Designed data models in **MongoDB** for flexible player progression tracking and event logging, supporting rapid feature iteration without schema migrations that had previously delayed releases.
- Participated in cross-functional discussions around technical architecture, contributing input on database selection and API design that improved developer velocity by enabling parallel feature development across four teams.
- Debugged production issues in multiplayer game servers by analyzing logs and monitoring server metrics, resolving race conditions in turn-based game logic that had caused player complaints.

EDUCATION

Ateneo de Manila University

Aug 2010–Jul 2014

Bachelor of Science in Computer Science
