

Esteban Sitek

Senior Solutions Engineer

estebanbenjaminsitek74@gmail.com · +54 93885170292 · San Salvador de Jujuy, Jujuy, Argentina · www.linkedin.com/in/esteban-benjamin-sitek-346771398/

PROFESSIONAL SUMMARY

Senior Solutions Engineer with **12+** years across healthcare, e-commerce, and gaming, delivering enterprise modernization and AI-assisted development solutions. Expert in Java ecosystem, OpenRewrite transformations, and CI/CD integration. Proven ability to lead customer engagements, design complex migrations, and bridge engineering organizations with platform capabilities using Maven, Gradle, and agentic workflows.

SKILLS

- Languages:** Java, Python, JavaScript, TypeScript, SQL, HTML, CSS
- Enterprise & Modernization:** OpenRewrite, Java/JVM Ecosystem, Maven, Gradle, Spring Boot, Dependency Management, Lossless Semantic Trees (LST), Static Analysis, SAST Tools, Code Transformation, Legacy System Migration
- AI-Assisted Development:** GitHub Copilot, Claude Code, Cursor, Coding Agents, LLM Integration, MCP, Agent Frameworks, Agentic Workflows
- Backend:** Node.js, Express, FastAPI, Django, Spring Framework, Microservices, RESTful Services, gRPC
- Frontend:** React, Vue.js, Next.js, Webpack, Vite, Bootstrap, Tailwind CSS
- Database:** PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch
- Testing:** Jest, Pytest, Selenium, Cypress, JUnit, TestNG, Playwright
- Cloud & DevOps:** Jenkins, GitHub Actions, GitLab CI, Docker, Kubernetes, Terraform, AWS, Google Cloud, Artifactory, Nexus, CI/CD Pipelines, Helm
- Others:** Git, GitHub, SonarQube, Checkmarx, Security Vulnerability Remediation, Technical Consulting, Customer Relationship Management, Workshop Facilitation, Solutions Architecture, Agile, Scrum

EXPERIENCE

- Publicis Sapient**
Senior Software Engineer

Jun 2024–Present
- Led the design and implementation of enterprise AI-assisted development workflows, integrating **GitHub Copilot** and **Claude Code** with deterministic code transformation pipelines to help organizations adopt agentic systems responsibly across distributed teams.
 - Collaborated with engineering leaders and platform teams to establish governance frameworks and validation practices for AI-generated code, including automated testing, approval processes, and rollback strategies using **GitHub Actions** and custom **Python** validation scripts.

- Architected solutions connecting modernization platforms with CI/CD infrastructure, troubleshooting complex integration challenges involving **Maven**, **Gradle**, private artifact repositories, and multi-module enterprise builds.
- Partnered with customer technical leadership to translate business modernization priorities into actionable technical strategies, identifying technical risks and adoption barriers across large-scale software portfolios.
- Developed reusable enablement materials and technical documentation for AI-assisted development patterns, including best practices for coding agents, deterministic transformation workflows, and code quality standards.
- Designed and validated custom transformation recipes for framework upgrades and dependency remediation, working with concepts such as **Lossless Semantic Trees** and static analysis to ensure accuracy and coverage.
- Conducted technical workshops and presented platform capabilities to engineering and executive audiences, translating complex modernization concepts into language appropriate for different organizational levels.
- Established observability and monitoring practices for large-scale transformation programs, tracking adoption metrics, coverage, and program progress across hundreds of repositories using custom dashboards and **PostgreSQL**-backed reporting.
- Troubleshooted ambiguous customer environments involving compilation failures, classpath conflicts, and pipeline integration issues, building evidence-based diagnostic plans to accelerate resolution.
- Contributed technical feedback to product teams on transformation gaps and customer pain points, advocating for scalable solutions while maintaining reusable platform practices.
- Resolved complex customer escalations requiring direct investigation into source code, build systems, and infrastructure, leveraging deep **Java** and **JVM** expertise to unblock modernization efforts.
- Mentored customer teams on **Spring Boot** modernization best practices, Java runtime upgrades, and the fundamentals of automated code transformation using deterministic approaches.

CareSimple

Oct 2022–May 2024

Senior Full Stack Engineer

- Spearheaded the modernization of legacy healthcare monitoring services by designing and deploying a microservices architecture using **Spring Boot**, **Maven**, and **PostgreSQL**, reducing deployment time from 60 minutes to under 15 minutes and improving system reliability.
- Owned the integration of **GitHub Actions** CI/CD pipelines with multi-module enterprise builds, troubleshooting **Gradle** dependency conflicts and private artifact repository issues that had been blocking team deployments for weeks.
- Architected the transition from monolithic Java applications to **Spring Boot** microservices, establishing governance practices and rollout strategies across three deployment waves, culminating in zero-downtime deployments for the patient monitoring platform.

- Collaborated with compliance and security teams to remediate critical dependency vulnerabilities across the codebase using automated scanning tools and **SonarQube**, reducing security findings by **67%** and establishing continuous compliance monitoring.
- Developed custom data transformation and migration logic using **Python** and **PostgreSQL** to handle patient data consistency across legacy and modernized systems, validating accuracy and completeness during the transition period.
- Led technical discovery sessions with engineering and product leadership to understand software portfolio constraints, identifying opportunities to consolidate three separate monitoring services into a unified **Spring Boot**-based platform.
- Implemented structured logging and distributed tracing using **Elasticsearch** and custom **Java** instrumentation, enabling the team to diagnose production issues in under 5 minutes instead of 30 minutes.
- Trained engineering teams on **Maven** best practices, dependency management, and troubleshooting compilation failures, reducing build-related incidents by **40%** and improving developer autonomy.
- Established automated testing frameworks using **JUnit** and **TestNG**, achieving **72%** code coverage on critical patient data handling logic and preventing regressions during modernization.
- Supported integration of the virtual care platform with enterprise CI/CD systems, working with **Jenkins** and **GitHub Actions** to enable rapid feature iteration while maintaining HIPAA compliance and audit trails.

Shopee

Jul 2018–Sep 2022

Full Stack Engineer

- Played a key role in building high-performance payment processing and order management services using **Java**, **Spring Framework**, and **Kafka**, handling over 80,000 daily requests across Southeast Asia's largest e-commerce platform.
- Designed and deployed reusable transformation patterns for legacy service refactoring, leveraging **Maven** and custom **Java** analysis tooling to identify technical debt and automate safe code migrations across 15+ internal microservices.
- Developed full-stack features spanning **React** frontend components, **Spring Boot** backend services, and **PostgreSQL** data models, working across distributed teams to deliver checkout workflow improvements that reduced cart abandonment by **18%**.
- Troubleshot complex dependency and classpath issues in the monolithic core services, working with enterprise artifact management systems and **Gradle** to resolve cascading build failures that had blocked the team.
- Established monitoring and observability using **Elasticsearch** and custom dashboards, enabling the infrastructure team to catch performance degradation in payment services before customer impact.
- Contributed to the migration of legacy payment systems from custom serialization to **Java** standard protocols, reducing errors and simplifying downstream system integrations across 20+ internal services.
- Implemented comprehensive test automation using **Selenium** and **Jest** for critical user flows, achieving **65%** coverage and reducing production defects by **42%** during high-traffic promotional periods.

- Collaborated with platform engineering teams to design and roll out **Docker** containerization across the backend services, reducing local development setup time from 2 hours to 10 minutes and standardizing CI/CD practices.
- Led technical workshops for peer engineers on **Spring Boot** patterns, distributed tracing, and production troubleshooting, building internal capability and reducing mean time to resolution for production incidents.
- Supported the integration of third-party payment gateways and logistics APIs, designing resilient fallback mechanisms and retry logic that improved transaction success rate from **94%** to **98.5%**.

Altitude Games

Nov 2014–Jul 2018

Full Stack Engineer

- Built core backend systems and APIs for multiplayer mobile games using **Node.js**, **Express**, and **MongoDB**, supporting concurrent gameplay for over 2 million monthly active users across iOS and Android platforms.
- Implemented game state persistence and matchmaking services using **Redis** for session caching, reducing latency from 800ms to 310ms and improving player retention by **22%** during peak gaming hours.
- Developed full-stack features spanning game UI in **React** and **TypeScript**, server logic in **Node.js**, and real-time synchronization using WebSocket, enabling seamless cross-platform gameplay experiences.
- Designed database schemas in **MongoDB** and optimized query performance using indexing strategies, handling 50,000+ concurrent connections and reducing database load by **35%** through intelligent query caching with **Redis**.
- Established **Git** workflows and automated testing practices using **Jest** for backend services and **Cypress** for game UI validation, reducing production bugs and enabling confident feature releases every two weeks.
- Collaborated with mobile engineers to design and document **REST API** contracts for game client-server communication, ensuring compatibility across five different game titles and multiple game engine versions.
- Set up **Docker** containerization and basic **Kubernetes** deployment for development environments, reducing on-boarding time for new engineering hires and standardizing local development setups.
- Performed production troubleshooting and incident response, diagnosing issues in distributed systems and working across teams to restore game availability, achieving **99.2%** uptime during competitive seasons.

EDUCATION

Ateneo de Manila University

Aug 2010–Jul 2014

Bachelor of Science in Computer Science
