

Wellington Santos

Data Engineer

santoss Wellington23@gmail.com · +55 19983546558 · Gonçalves Dias, Maranhão, Brazil · www.linkedin.com/in/welington-santos-53044a3b2/

PROFESSIONAL SUMMARY

Data Engineer with **8+** years across e-commerce, fintech, and healthcare IT, specializing in SQL-driven data pipelines and cloud infrastructure. Experienced in ETL processes, data quality validation, and staging layer development using SQL Server, AWS, and modern data platforms. Proven ability to mentor teams, document complex transformations, and deliver reliable data solutions supporting business-critical migrations.

SKILLS

- Languages:** SQL, Python, JavaScript, TypeScript, Java, HTML, CSS
- Data & ETL:** ETL, Data Profiling, Data Validation, Data Quality, Stored Procedures, SQL Views, Data Reconciliation, Airflow, Apache Spark, dbt
- Database:** SQL Server, PostgreSQL, AWS RDS, MySQL, Redis, Elasticsearch
- Cloud & DevOps:** AWS, AWS S3, AWS Secrets Manager, Docker, Kubernetes, GitHub Actions, CI/CD, Terraform, Linux
- Testing:** Jest, Pytest, Data validation queries, Reconciliation checks
- Others:** Excel, GitHub, Jira, Confluence, Agile, Scrum, Kanban, Claude, GitHub Copilot, RESTful API, GraphQL, Git

EXPERIENCE

- Fanatics**
[Senior Data Engineer](#)

Oct 2023–Present
- Led the design and implementation of staging pipelines for the sports commerce platform, building **SQL Server** views and stored procedures that transformed raw transactional data into target schema formats, serving 15+ internal analytics teams with validated daily extracts.
 - Spearheaded data profiling initiatives across the collectibles and betting domains, profiling millions of policy and transactional records to identify mapping gaps and anomalies, documenting findings in structured data dictionaries that reduced ETL rework by **32%**.
 - Drove the migration of legacy reporting infrastructure to **AWS RDS**, designing cloud-native staging tables and implementing **AWS S3** data export workflows that eliminated single points of failure and reduced query latency from 8 seconds to under 1 second for compliance reporting.
 - Built comprehensive data validation frameworks using **SQL** reconciliation queries and automated checks, catching data quality issues before production cutover and ensuring **99.2%** accuracy on sensitive transactional records across multiple product lines.

- Mentored three junior engineers on advanced **SQL** techniques including window functions, CTEs, and query optimization, fostering a culture of code review and best practices that improved overall pipeline maintainability and reduced incident response time by 40%.
- Implemented **GitHub Copilot**-assisted SQL development workflows, using prompt engineering to accelerate profiling script generation and data transformation logic while maintaining rigorous validation of AI-generated outputs against business requirements.
- Collaborated with product and finance stakeholders on iterative data quality cycles, resolving **30+** load report findings and delivering clean data packages that enabled accurate revenue forecasting and reconciliation across sports betting verticals.
- Documented all data mappings, transformation logic, and **SQL** procedures in **Confluence**, creating reusable reference materials and knowledge articles that reduced onboarding time for new team members from 3 weeks to 10 days.
- Maintained **AWS Secrets Manager** credentials and enforced secure data handling practices across staging pipelines, ensuring compliance with PII protection standards and financial data regulations across the commerce ecosystem.
- Optimized ETL load performance by refactoring legacy stored procedures, replacing cursor-based logic with set-based **SQL** operations, which cut nightly batch processing time from 2.5 hours to under 30 minutes without sacrificing accuracy.
- Drove adoption of **Agile** and **Kanban** methodologies for data engineering sprints, working with **Jira** to track pipeline development, data quality issues, and feature rollouts, improving sprint velocity by **28%** and delivery predictability.
- Assisted in evaluating emerging data tools for next-generation ETL, documenting pros/cons of **dbt**, **Apache Spark**, and **Airflow** relative to current SQL Server + **AWS** stack, preparing technical recommendations for infrastructure modernization.

Walmart

Sep 2022–Oct 2023

Senior Data Engineer

- Owned data integration for Walmart's e-commerce and financial services domains, building **SQL Server** views and stored procedures that ingested millions of daily customer transactions, payment records, and inventory updates into a unified analytics warehouse.
- Drove a critical data migration project from legacy on-premise SQL databases to **AWS RDS**, profiling source schemas, designing staging tables, and orchestrating iterative validation cycles that ensured zero data loss and **100%** reconciliation on 18 months of historical transaction data.
- Designed and implemented a reusable data validation framework using **SQL** window functions and reconciliation checks, which caught a dormant data quality issue in the financial services domain affecting **2.3M** customer records before production exposure.
- Collaborated with the Walmart Connect (retail media network) analytics team to establish data profiling standards and naming conventions, creating documentation and reference implementations that accelerated onboarding of two new junior data engineers by 6 weeks.

- Resolved complex data quality anomalies in customer master data by tracing root causes across related **SQL Server** tables, identifying and correcting **847** mapping errors in product category hierarchies that had been silently propagating downstream for months.
- Built **Excel**-based data review dashboards and profiling summary reports that stakeholders used to understand source data quality before transformation, reducing back-and-forth review cycles by **45%** and accelerating sign-off on staging design documents.
- Implemented **AWS S3** export workflows for secure PII handling, leveraging **AWS Secrets Manager** for credential management and enforcing encryption at rest and in transit, meeting financial services compliance requirements and passing third-party security audits.
- Mentored a mid-level engineer on advanced **SQL** optimization techniques, conducting pair programming sessions on query tuning and execution plan analysis, resulting in a **35%** reduction in slow-running ETL jobs and improved team technical depth.
- Documented all data pipeline specifications, **SQL** transformation logic, and ETL procedures in **Confluence**, maintaining a centralized knowledge repository that reduced time to troubleshoot issues from hours to minutes by enabling self-service root cause analysis.

E-POT

Jun 2018–July 2022

Full Stack Data Engineer

- Built data pipelines for medical and financial systems across multiple clients, designing **SQL** staging views and stored procedures that extracted transactional data from legacy banking and healthcare IT platforms, transforming and loading into target reporting schemas.
- Profiled source system data across healthcare insurance and financial services domains, identifying data quality gaps in patient records and transaction histories that required 18 distinct transformation rules and reference table mappings implemented in **SQL Server** CTEs.
- Developed and maintained reconciliation queries and validation checks in **SQL**, catching data integrity issues in payment processing systems before they propagated to downstream analytics, reducing financial reporting discrepancies by **18%**.
- Collaborated with healthcare IT stakeholders to define data transformation logic for medical claims data migration, documenting mapping requirements and building reusable **SQL** procedures that supported iterative testing across three product lines.
- Implemented data export workflows to **AWS** cloud environments, designing **AWS RDS** staging tables and **AWS S3** file staging areas that enabled secure PII handling and compliance with healthcare data protection standards for remote analytics teams.
- Used **GitHub** for version control of **SQL** scripts and ETL documentation, establishing branching workflows and code review practices that improved code quality and made it easier to roll back failed migrations without data loss.
- Analyzed data quality issues in legacy banking systems using **Excel** pivot tables and profiling queries, identifying root causes of duplicate records and missing foreign key relationships that had been causing daily reconciliation failures.
- Supported **Agile** sprint planning and delivery using **Jira**, documenting ETL requirements as data tickets and tracking progress through staging pipeline development, testing, and production rollout cycles.

EDUCATION

University of Tokyo

Apr 2014–Mar 2018

Bachelor of Science in Computer Science
