

Wellington Santos

Senior Fullstack Engineer

santosswelington23@gmail.com · +55 19983546558 · Gonçalves Dias, Maranhão, Brazil · www.linkedin.com/in/welington-santos-53044a3b2/

PROFESSIONAL SUMMARY

Senior Fullstack Engineer with **8+** years across sports commerce, retail fintech, and healthcare IT, building resilient payment and integration systems. Expert in backend architecture, REST APIs, webhooks, and event-driven workflows using **Java**, **PostgreSQL**, and cloud infrastructure. Proven track record designing integration frameworks, qualifying partner requirements, and delivering production-grade connectors with observability and compliance built-in.

SKILLS

Languages: Java, Python, JavaScript, TypeScript, SQL, HTML, CSS

Backend: Spring Boot, Node.js, Express, FastAPI, Kafka, RabbitMQ, gRPC

Frontend: React, Next.js, Vue.js, Tailwind CSS, Redux

Database: PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch

Testing: Jest, Pytest, JUnit, Cypress, Selenium

Cloud & DevOps: AWS, Docker, Kubernetes, Terraform, GitHub Actions, Jenkins, CloudWatch

Others: RESTful API, Webhooks, OAuth2, GraphQL, API Design, Event-Driven Architecture, Observability, Prometheus, Grafana, Datadog, Git, GitHub, Jira, PCI Compliance, Idempotency, Data Mapping

EXPERIENCE

Fanatics

Oct 2023–Present

Senior Software Engineer

- Led the design and implementation of a **Java** and **Spring Boot**-based integration platform that qualified and onboarded third-party payment processors, reducing integration time from 6 weeks to 10 days through reusable connector patterns and shared authentication libraries.
- Drove the rollout of **REST API** and **Webhooks** infrastructure for real-time inventory synchronization across sports commerce and collectibles systems, handling **80k+** daily events and ensuring idempotency across 200+ partner touchpoints.
- Owned the full integration lifecycle for 12+ strategic partners including ticketing systems and merchandise platforms, conducting Phase 0 qualification assessments, scoping build effort, and delivering production runbooks with **Prometheus** and **Grafana** observability dashboards.
- Architected a **PostgreSQL**-backed data mapping engine with drag-and-drop field transformations, cutting manual field configuration time by **65%** and enabling non-technical onboarding specialists to qualify new connector requests without engineering review.

- Implemented OAuth2 token management and PCI-compliant secrets handling across the integration framework using **Kubernetes** secrets and **AWS** parameter store, eliminating credential exposure incidents and meeting security audit requirements.
- Collaborated with platform and API teams to extract reusable primitives from integration work, including standard **Kafka**-based event contracts that became the foundation for four new internal services.
- Drove clean handoffs by delivering integration runbooks, on-call playbooks, and support dashboards before marking engagements as production-ready, reducing post-launch incidents by **45%** and improving partner satisfaction scores.
- Used AI code generation tools to scaffold 18+ connector templates in **Spring Boot**, cutting boilerplate authoring time by **40%** while maintaining code quality standards and consistency.
- Mentored two mid-level engineers on integration patterns, **REST API** design, and webhook resilience, resulting in two independent partner onboardings by quarter-end.
- Worked closely with non-technical stakeholders including partner technical leads and internal product teams, translating ambiguous integration requests into scoped technical roadmaps and managing timeline expectations across five concurrent engagements.
- Debugged and resolved a critical idempotency bug in the payment order connector that was causing duplicate charges, tracing the issue across **Node.js** microservices and **PostgreSQL** transaction logs and implementing atomic write patterns.
- Established observability standards for all integrations, adding structured logging to **Datadog** and defining SLOs for event latency and sync accuracy across the connector portfolio.

Walmart

Sep 2022–Oct 2023

Senior Software Engineer

- Spearheaded the development of a fintech payment processing service in **Java** and **Spring Boot** that handled bill pay and financial data routing for the underbanked customer segment, processing **150k+** daily transactions with **99.95%** uptime.
- Built **REST API** endpoints and **Webhooks** for merchant settlement notifications and payment status webhooks, integrating with internal ledger systems and third-party banking partners using **OAuth2** and token refresh patterns.
- Designed and implemented a **Kafka**-based event-driven reconciliation pipeline that matched payment intents to settlement records, reducing end-of-day manual reconciliation by **8 hours** per shift and cutting accounting errors by **92%**.
- Owned the integration of a new logistics partner API into the fulfillment platform, conducting requirements gathering, defining **REST API** contracts, implementing data mapping transformations in **PostgreSQL**, and delivering integration runbooks.
- Hardened secrets management across three backend services by migrating from environment variables to **AWS** Parameter Store and implementing automated credential rotation, eliminating credential leaks in logs and reducing compliance audit findings.

- Implemented comprehensive observability across payment services using **Prometheus** metrics and structured logging to **Datadog**, enabling the team to reduce incident resolution time from 45 minutes to under 10 minutes.
- Coordinated with platform engineering to standardize **Kubernetes** deployment configs and helm charts across the fintech squad, reducing deployment failures by **35%** and enabling junior engineers to ship confidently.
- Refactored a critical payment retry mechanism that had been causing duplicate charges during network failures, introducing idempotency keys and dead-letter queue patterns using **RabbitMQ**, eliminating charge duplication incidents entirely.

E-POT

Jun 2018–July 2022

Full Stack Engineer

- Built end-to-end medical data integration connectors in **Python** and **FastAPI**, synchronizing patient records and billing information from EHR systems to internal analytics platforms using **REST API** patterns and secure SFTP data delivery.
- Designed a configurable field-mapping framework for healthcare IT integrations that allowed technical staff to adapt connectors to new EHR systems without code changes, enabling the team to onboard four new healthcare provider networks without backend engineering effort.
- Implemented **PostgreSQL** schema redesigns for three healthcare data pipelines, optimizing query performance by **58%** through denormalization and selective materialized views, directly improving dashboard load times for clinical administrators.
- Contributed to an internal integration platform built on **FastAPI** and **Redis** caching that exposed RESTful endpoints for common healthcare workflows, reducing integration time for internal finance and manufacturing IT teams by **40%**.
- Added structured logging and **Prometheus** metrics to all healthcare connectors, providing visibility into data sync failures and latency, which caught a PII data leakage bug before it reached production.
- Collaborated with compliance teams to document PII data handling and retention policies across all integrations, ensuring HIPAA and internal security audit requirements were met.
- Mentored junior engineers on full-stack development practices, code review standards, and debugging techniques, supporting the onboarding of five new team members into healthcare IT projects.
- Owned the integration of a new pharmacy billing system, writing documentation, defining **REST API** contracts, implementing data transformations, and training customer success team members on troubleshooting and runbook execution.

EDUCATION

University of Tokyo

Apr 2014–Mar 2018

Bachelor of Science in Computer Science
