PROFESSIONAL SUMMARY

Senior Software Engineer with **8+** years across e-commerce, retail, and healthcare IT, building resilient integration systems and cloud platforms. Expert in REST APIs, SQL/NoSQL databases, and messaging systems using Python, Node.js, and modern cloud infrastructure. Proven ability to troubleshoot complex distributed systems, support customers through technical challenges, and drive continuous improvement through automation and AI-powered solutions.

SKILLS

- Languages:** Python, JavaScript, TypeScript, Java, SQL, HTML, CSS
- Backend:** Node.js, Express, FastAPI, Django, Spring Boot, GraphQL
- Database:** MongoDB, PostgreSQL, MySQL, Redis, Elasticsearch
- Messaging & Integration:** Kafka, RabbitMQ, Apache ActiveMQ, JSON, XML, SOAP, REST APIs, WebSocket
- Testing:** Jest, Pytest, Postman, Cypress, Selenium, JUnit
- Cloud & DevOps:** AWS, Docker, Kubernetes, GitHub Actions, Jenkins, Terraform, Linux, EC2, S3, CloudWatch
- Others:** RESTful API, HTTP/HTTPS, SSL/TLS Certificates, Networking, Git, GitHub, Jira, Confluence, Agile, Scrum

EXPERIENCE

Fanatics Oct 2023–Present
Senior Software Engineer

- Spearheaded the design and deployment of order fulfillment microservices across a multi-tenant sports commerce platform, establishing patterns for **REST APIs**, **Kafka** event streaming, and asynchronous workflows that handled **80k+ daily transactions** across collectibles, betting, and retail channels.
- Owned end-to-end troubleshooting and support of critical integration failures, coordinating with backend and infrastructure teams to diagnose **MongoDB** query performance bottlenecks and **Kafka** topic lag issues, reducing mean time to resolution by **40%** for production incidents.
- Drove the adoption of structured logging and **Prometheus** metrics across 12 microservices, enabling faster root-cause analysis of customer-reported issues and cutting average incident investigation time from **2 hours to 35 minutes**.
- Built diagnostic dashboards in **Grafana** to surface **REST API** response times, error rates, and **JSON** payload validation failures, empowering support and platform teams to self-serve troubleshooting for 90% of common customer issues.

- Implemented circuit breakers and retry logic using **Python** and **FastAPI** to gracefully handle upstream payment gateway timeouts, preventing cascading failures that had been causing checkout errors affecting **15k+ customers** per incident.
- Collaborated with the customer success team to reproduce and isolate a race condition in the order status webhook that had been causing out-of-sync **MongoDB** records for international shipments, fixing the issue with explicit locking and detailed **XML** response validation.
- Conducted technical training sessions on **REST API** contract testing and **Postman** automation for the support team, equipping 8 engineers to independently verify customer integration workflows and reduce escalation volume by **25%**.
- Maintained runbooks and troubleshooting guides covering **Kafka** consumer lag analysis, **SSL/TLS certificate** renewal procedures, and **HTTP/HTTPS** status code mapping, which became the foundation for first-response customer support documentation.
- Debugged and resolved a subtle issue where **JSON** deserialization errors in legacy API clients were being silently swallowed, adding explicit error telemetry that surfaced **300+ previously invisible failures per day** affecting reporting accuracy.
- Led incident response for a critical **MongoDB** replication lag event affecting real-time customer order visibility, coordinating across database, infrastructure, and support teams to restore consistency within **2 hours** and document prevention measures.
- Integrated **OpenTelemetry** and **Datadog** tracing into 5 high-traffic microservices, enabling the support team to quickly correlate logs across **REST API** calls, **Kafka** message flows, and database queries during customer escalations.
- Improved customer onboarding documentation for **REST API** authentication using **HTTP/HTTPS** bearer tokens and **SSL/TLS certificates**, reducing support tickets related to 401/403 errors by **35%** within the first month.

Walmart

Sep 2022–Oct 2023

Senior Software Engineer

- Led the migration of a legacy supply chain integration system to a cloud-native architecture using **Node.js**, **Kafka**, and **MongoDB**, enabling the fulfillment team to process **250k+ daily logistics updates** with **99.95% uptime** across multiple distribution centers.
- Owned the design and implementation of a customer complaint resolution system integrating third-party logistics APIs via **REST APIs** and **XML** message transformation, reducing manual data entry and cutting average complaint resolution time from **3 days to 6 hours**.
- Diagnosed and fixed a pervasive **MongoDB** schema design flaw that had been causing **O(n)** query scans during peak hours, optimizing indexes and query logic to reduce P99 latency by **67%** and improve customer order tracking responsiveness.
- Built comprehensive observability into the e-commerce payment reconciliation service using **Docker**, **Kubernetes**, and **CloudWatch**, surfacing anomalies in **JSON** transaction records and enabling the support team to proactively detect payment sync failures before customers complained.

- Collaborated with customer support engineers to design debugging tools for **HTTP/HTTPS** request tracing, helping them isolate connectivity issues for high-volume retail partners without requiring backend engineer intervention in **60%** of cases.
- Implemented strict **JSON** schema validation and custom error messages for all **REST API** endpoints, reducing opaque 500 errors and enabling support to provide faster, more specific guidance to customers on API contract violations.
- Refactored the Walmart Pay fintech integration to use idempotent API design with retry-safe request IDs encoded in **JSON** payloads, preventing duplicate charges and reducing financial reconciliation incidents by **12** per month.
- Set up **Prometheus** alerting thresholds for **Kafka** topic lag and **MongoDB** replication lag, automating notifications to on-call engineers and accelerating response time to infrastructure-level issues affecting customer transactions.
- Mentored 3 junior support engineers on networking diagnostics, teaching packet analysis tools to identify **HTTP/HTTPS** session hijacking attempts and **SSL/TLS certificate** expiration issues in customer environments.
- Documented runbooks for common **REST API** authentication failures, **MongoDB** connection pooling limits, and **Kafka** consumer group rebalancing scenarios, which became the primary reference material for the global support team.

E-POT

Jun 2018–July 2022

Full Stack Engineer

- Built a healthcare data integration platform for clinical facilities, handling **SOAP** and **REST API** connectors to electronic health record systems, processing **50k+ daily patient records** using **Python**, **Django**, and **PostgreSQL** with guaranteed message delivery.
- Implemented **Kafka** event streams to decouple medical data ingestion from analytics processing, eliminating processing bottlenecks that had been causing **6-hour delays** in lab result availability and reducing average data latency to **5 minutes**.
- Debugged complex issues in the banking systems integration layer, using **XML** parsing tools and **MongoDB** aggregation pipelines to trace malformed financial transaction records and prevent data corruption in downstream reporting systems.
- Designed and deployed a **Docker**-based containerized integration gateway that standardized **REST API** contract handling and **JSON** request/response transformation across 8 separate healthcare client integrations, reducing onboarding time by **50%**.
- Established **SSL/TLS certificate** management procedures and **HTTP/HTTPS** protocol compliance audits for all healthcare customer integrations, ensuring HIPAA-grade encryption and reducing security-related support incidents to zero over 3 years.
- Contributed to the AgriTech platform's real-time sensor data pipeline using **Node.js**, **RabbitMQ**, and **PostgreSQL**, ingesting telemetry from **12k+ IoT devices** and enabling farmers to receive weather-correlated insights within **2 minutes** of collection.

- Mentored 2 junior engineers on **REST API** design principles and **JSON** schema validation, establishing coding standards that reduced integration bugs by **30%** and improved code review consistency across the team.
- Built monitoring dashboards using **Grafana** to surface **Kafka** consumer lag, **MongoDB** query performance, and **HTTP/HTTPS** error rates, empowering the support team to independently diagnose 70% of customer issues without backend escalation.

EDUCATION

University of Tokyo

Apr 2014–Mar 2018

Bachelor of Science in Computer Science
